Radiation Curable Amine-Quinone Polymers

Sukhendu B. Hait and David E. Nikles

MINT Center and Home Department
The University of Alabama

Sponsored by the U. S. Environmental Protection Agency

THE UNIVERSITY OF ALABAMA
Objectives

Synthesize new radiation curable amine-quinone polyurethanes

Demonstrate that these polymers can promote the dispersion of commercial iron particles in liquid acrylates

Demonstrate that these polymers protect commercial iron particles against corrosion

Demonstrate that these polymers protect metals against corrosion
Rheological Properties of Solventless Metal Particle Dispersions

The amine-quinone polyurethanes were chemisorbed onto the commercial iron particles from cyclohexanone solution.

The surface treated particles were dispersed in propylene glycol diacrylate.
Synthesis of Amine-Quinone Polyurethane with Acrylate Groups in the Side Chain

\[
\begin{align*}

Comparative Corrosion Studies

Tape samples containing commercial iron particles
Exposed to pH 2.0 aqueous buffer
The samples having AQPUDA-1 showed no corrosion by pH 2.0 aqueous buffer
Radiation curable amine-quinone polymer protect commercial iron particles against corrosion
EIS Studies of Corrosion Protection of Metals by Radiation Curable Amine-Quinone Polymers

Bode plots for AQPUDA-2 films on iron, fig. 4a, or on Al-2024T3, fig. 4b, exposed to 0.1 M NaCl electrolyte. Circles — impedance curves, squares — phase angle curves. Fig. 4a, open symbols — initial curves, closed symbols — after 230 days exposure. Fig. 4b, open symbols — initial curves, closed symbols, after 8 days exposure.
Conclusions

Radiation curable amine-quinone polymers promote dispersion of commercial iron particles in liquid acrylates.

The polymers protected commercial iron particles against corrosion by pH 2.0 aqueous buffer.

The polymer protected iron and aluminum aircraft alloys against corrosion.

Acknowledge Huimin Bie for obtaining EIS data.
